Automatic Audio Balancer

The output of speakers adjusts according to your location. Your remote control or any other portable device tells the system where you are. The balancer function balances the speaker's output so sounds are heard in an equally loud fashion from multiple speakers. Wherever you are, it sounds like you're in the middle of the sound system. Designated audio and or visual signals adjust to the user's tastes based on User Information Programming™

Examples:

- Segments tagged as commercials can be "edited" out.
- Adjusts for the hearing impaired or the type of hearing device being used in one or both ears.
- If system can't identify human's locations it can default to standard audio settings.
